ALIN

阿琳 · Lynix / Product & interaction portfolio

A few thoughts, a few worlds.

HomeMind / A little workspace. / Digest / Starity / Naituan's Little House · 奶团小屋

A LITTLE ABOUT ME

Between ideas and reality, I like to make a little something.

I'm Alin, also known as Lynix. A good idea shouldn't live only in the mind. What do you think?

HOW I MAKE THINGS

Start from a problem close by, and make an idea into something you can try.

01 **First, find the specific snag**

First say which moment feels awkward, then decide what kind of tool it needs.

02 **Turn the relationship into a visible experience**

I set the need and the direction, and with AI turn the idea into a prototype you can try.

03 **Keep adjusting while trying it**

Find the burden in real use, keep what is useful, and let the work keep growing.

FOUR PLACES TO BEGIN

01 **HomeMind** 03 – 05

Understanding can be proposed by AI. A habit needs to be confirmed by a person.

02 **Alin's Workspace** 06 – 08

Let the tool follow the order of a person's attention, and leave room to change it.

03 **Digest** 09 – 10

Each stage has a place. Each result has a confirmation.

04 **Starity · Xiaoji** 11 – 13

Let what was done together be picked up again.

Also: Naituan's Little House / 14, and ongoing explorations / 15

01 / AI × EVERYDAY LIFE

HomeMind

Let home understand you, a little.

When the AI thinks it already understands, how do you leave the right to confirm with the person?

Arrangements at home change: tired today, wanting to sleep in on the weekend, a room that is not convenient to clean for now. HomeMind explores letting people say these changes in everyday language, then putting the system's understanding in front of them, so they can decide what to do this time and whether to keep doing it later.

Format · AI product concept / mobile interaction prototype

My role · Product idea, interaction design, and building it together with AI

HOMEMIND / EXPLAIN, THEN CONFIRM

Turn the process of understanding into an interaction a person can join.

Explain the guess first, then invite confirmation

Place the basis of the observation next to the suggestion, so the user can understand where this judgment comes from before deciding whether to accept it. The conversation does not only receive instructions. It also explains.

Trade-off / One more step of reading, in exchange for a clearer expectation of automatic changes. The explanation needs to stay short enough not to take attention away from the task itself.

Separate a one-time change from a long-term habit

Separate this cleaning, a phased adjustment, and a long-term preference. That way, “I don't want to clean today” does not easily become “don't clean from now on.”

Trade-off / One more scope has to be stated, but it reduces the ambiguity of one agreement being extended into a long-term rule.

01 **Say what is needed now**

From the home screen, enter a conversation with Rocky and describe the hoped-for change in the words of daily life.

02 **See why it was understood that way**

The conversation shows observations and guesses, and explains why the system offers this suggestion.

03 **Choose the scope of the change**

Separate a one-time arrangement, a period of time, and a long-term habit, so what is agreed to is more specific.

04 **Check again in Growth**

On the growth page, look at what is being understood, waiting for confirmation, and already learned.

Conversation prototype: the basis of an observation, the explained guess, and the adjustment options appear along the same exchange. Records and counts in the image are demo data.

HOMEMIND / AI × EVERYDAY LIFE

Give “understanding you” a process you can see.

Give “not yet certain” a visible place

The growth page shows states such as being understood, waiting for confirmation, and waiting for the household to review. Items already learned keep showing whether they are in effect or still being watched, so forming a habit has a process you can look at.

Trade-off / There are more states than a simple switch, so they need to be organized by “whose turn it is to do what next,” rather than asking a person to learn backend terms.

What exists now

- Formed mobile screens for home, conversation, growth, and family, and kept an interactive prototype that can be talked about.
- Clarified the experience path “say a need → see the basis → choose a scope → check growth.”
- Separated the system's guess from the person's confirmation, so the boundary of automation is easier to discuss.

What I want to test next

- See whether a first-time user can tell “just this time” from “a long-term change,” then simplify the confirmation copy.
- When adjusting, cancelling, and completing, check that the plan summary and the item states stay consistent.

Scope shown: product concept and interactive prototype screens. Screenshots include demo data. This case does not claim a real device is connected, and does not infer results of use from the sample counts.

02 / A SPACE OF YOUR OWN

A little workspace.

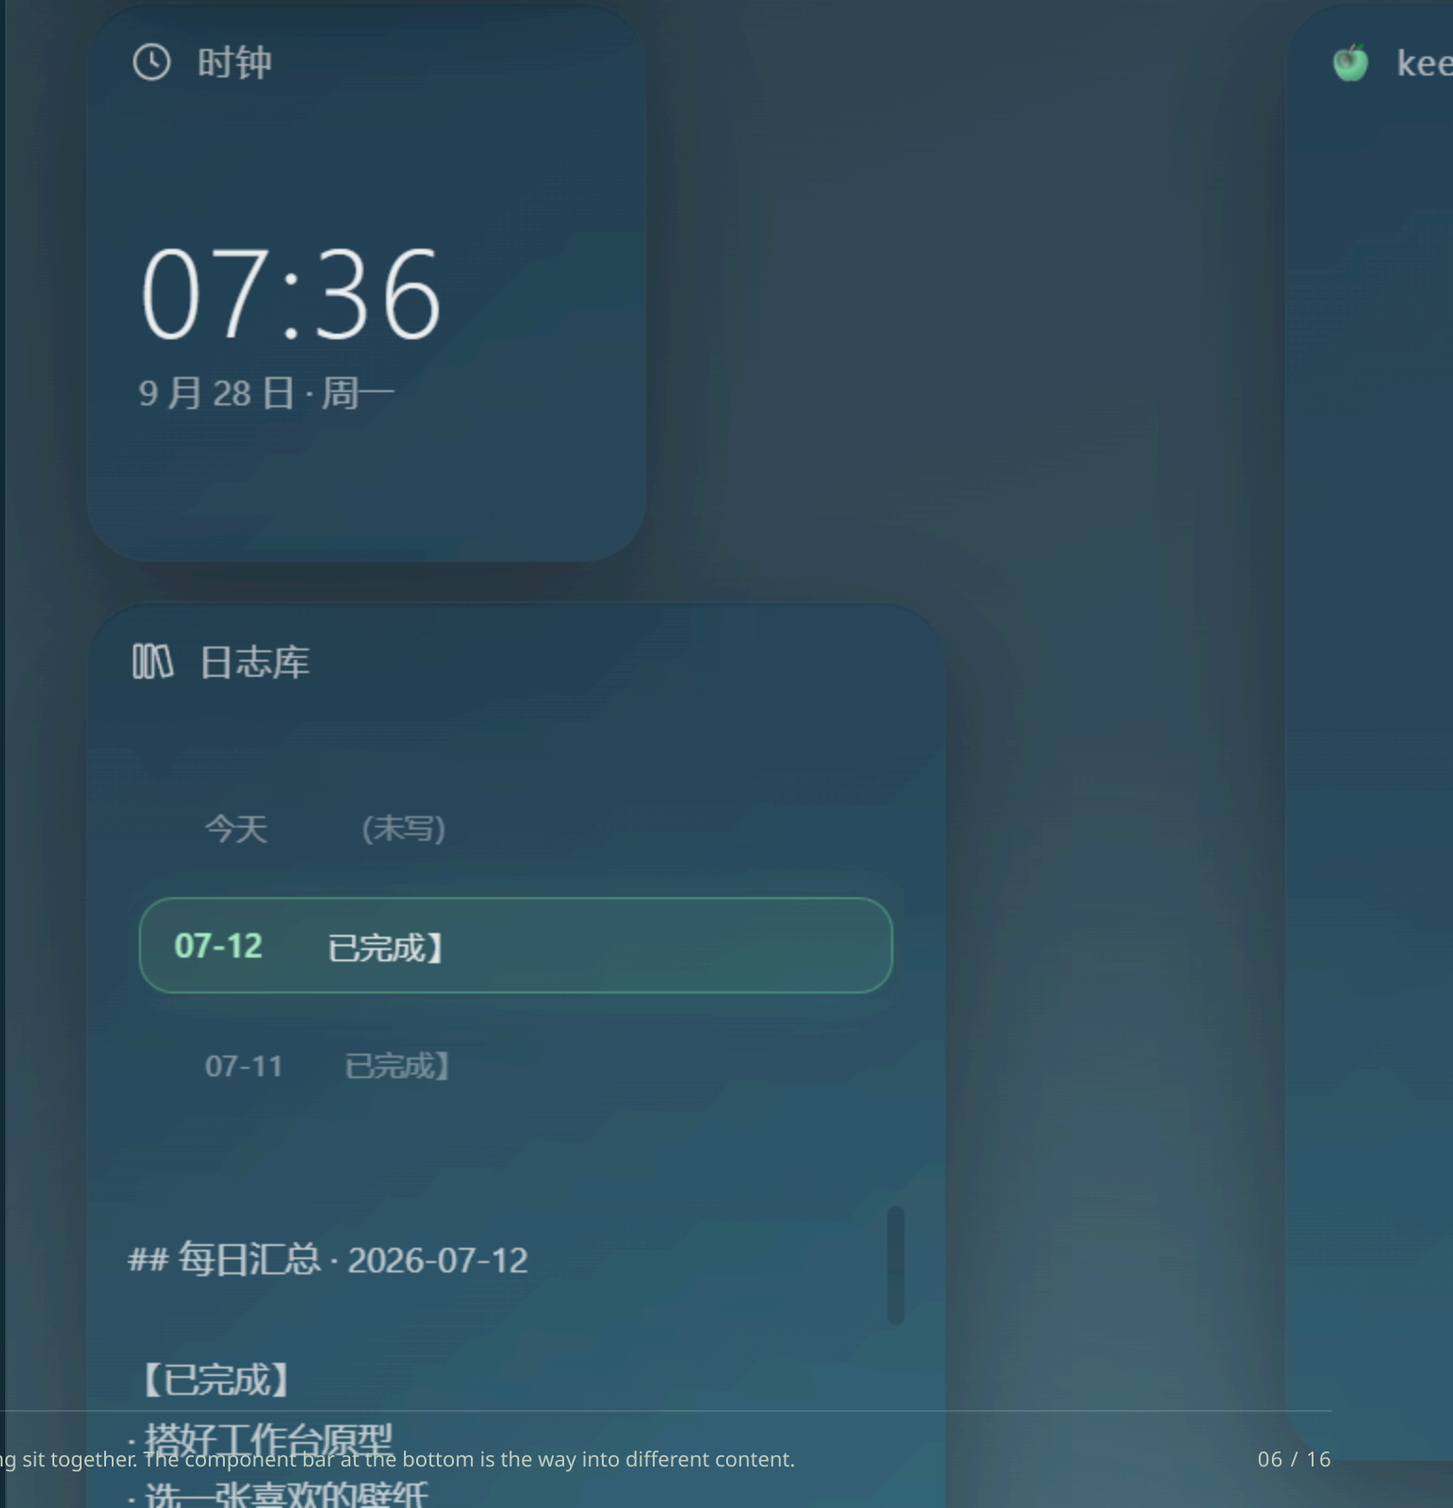

A desktop, grown into its own shape.

Keep what you often look back at in front of you.

Offer a starting point with small widgets that have a clear use, then leave position and visual mood to the person using them. What matters can come closer. What is not needed for now can step back.

Format · Personal desktop tool / Electron prototype

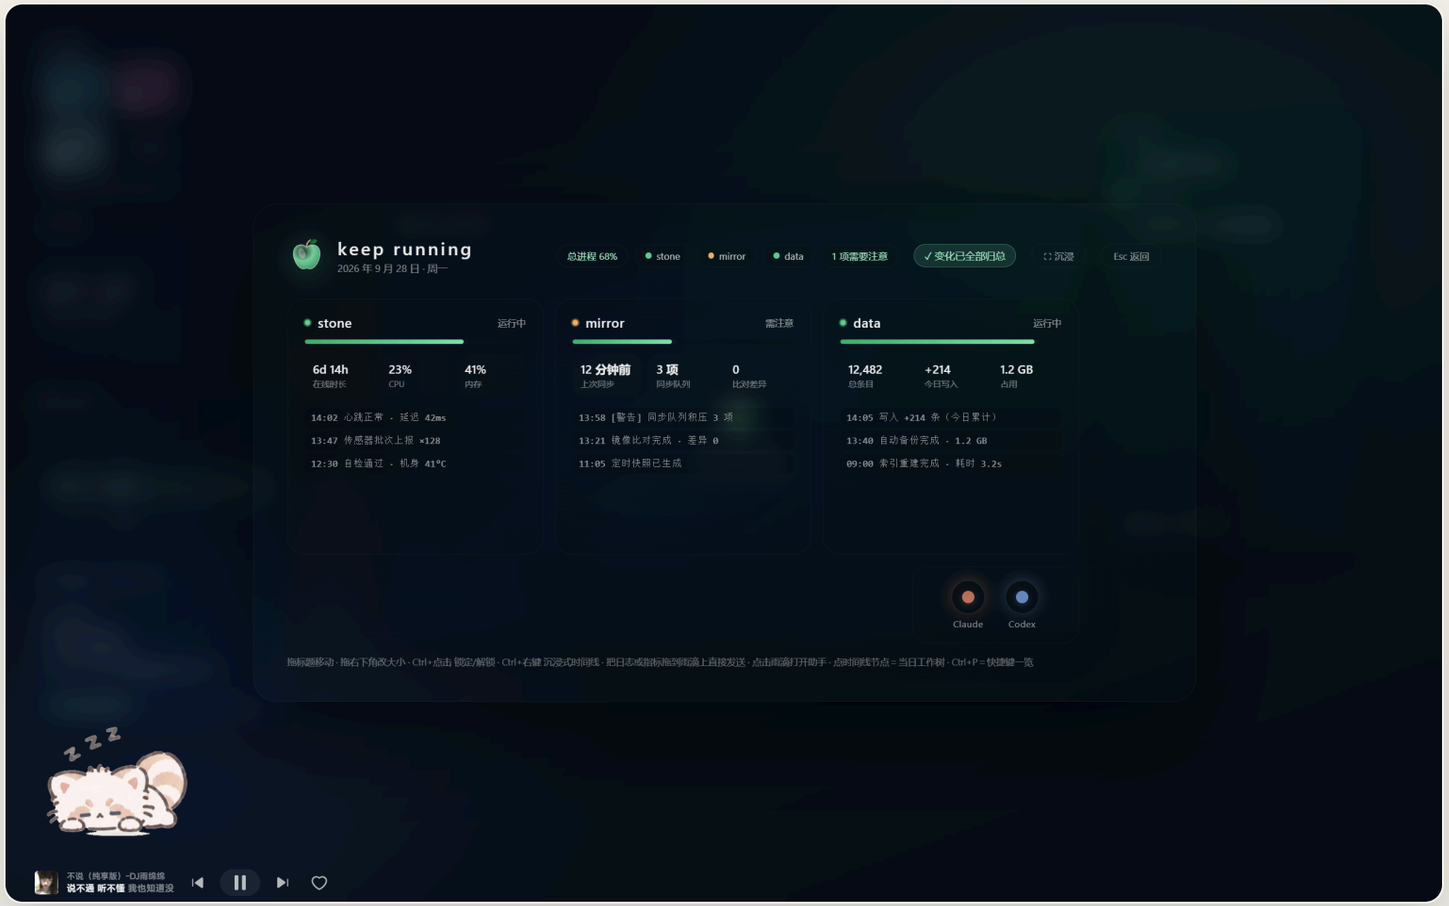

My role · The situation of use, the interaction idea, and building it together with AI

Screenshot 01 / everyday desktop: wallpaper, clock, log library, to-dos, and keep running sit together. The component bar at the bottom is the way into different content.

WORKSPACE / KEEP RUNNING

From “put it all in,” to “arrange it the way I need now.”

From a desktop overview into a more focused panel

keep running can be a brief status entry on the desktop. Opened, it shows each project's state and log. The everyday overview and the detail stay apart, so what is needed appears when it should.

Trade-off / The detail has more room, and a clear way back is still needed, so a person can return to the desktop they left.

01 **Find what you look at often**

Use parts such as a clock, notes, and to-dos to first place everyday needs in one space.

02 **Arrange what matters now**

Move the parts so what you are attending to is easier to reach. Use position to show weight.

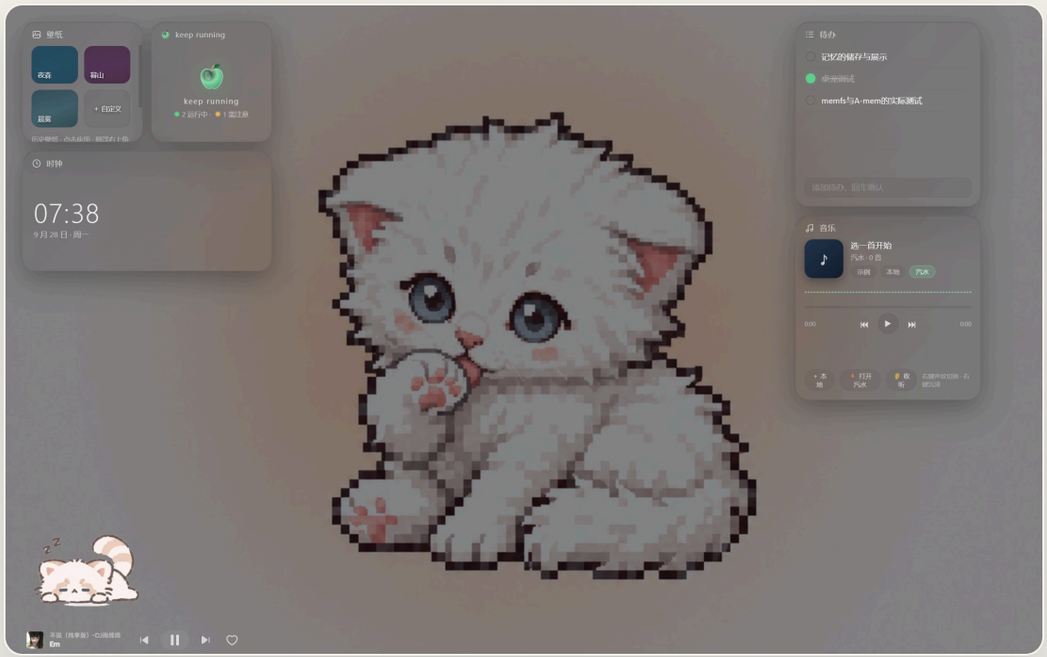

03 **Leave a way to continue**

Logs and daily archives in the original keep the process, so coming back to a task has a thread to follow.

Screenshot 02 / keep running detail: the overview opens into project state, progress, and logs. Numbers on the screen show how information is organized. They are not proof of real running results.

WORKSPACE / A PLACE THAT FEELS LIKE YOU

Turn “work at your own pace” into a space you can touch.

What exists now

- Three real screenshots show the everyday desktop, the running detail, and a custom wallpaper.
- The portfolio offers a fragment where widgets can be dragged, a to-do checked, the wallpaper switched, and the layout reset.
- Puts the product idea, the spatial organization, and the visual mood into one case that can be talked about.

Use parts as a start, and leave the layout free

Inside a widget the use stays clear. Between widgets, rearranging is allowed. The clock keeps the time, the note catches a thought, the to-do holds the next step. They do not have to compete for the same structure.

Trade-off / Freedom costs tidying. The demo keeps a default position and a reset, so after trying something you can come back easily.

Treat mood as a personal choice too

Wallpaper and color decide how this space feels. Making them light choices connects the workspace to a personal day.

Trade-off / Visual change has to give way to text that can be read. However the background changes, the edges and the content of the parts should stay clear.

What I want to test next

- See which parts really need to stay on screen, and reduce what is piled there just to look complete.
- Keep exploring how a free layout stays readable at different screen sizes.

Scope shown: three real interface screenshots from Alin, and a fragment of the experience on the web. Actions on the page are not saved to the original desktop app. States and numbers in the screenshots are not proof of measured efficiency, or of a tested service.

03 / THOUGHTS INTO MOTION

Digest.

Let an idea land, step by step.

See where an idea sits, and then you know where the next step goes.

Organize the center into digest, execute, and settle, and keep distinctions such as to execute, in progress, to confirm, and confirmed. The left and right bars take locating and overview.

Format · Work board / an exploration of interface and interaction

My role · The need and the experience, and visual iteration

Current interface: keeps the main spatial structure, and makes the execute and confirm states, the tags, and the action entries more specific.

DIGEST / FROM SKETCH TO SCREEN

Let the structure of the space show how a thing moves forward.

01 / Early sketch

02 / Current interface

Digest: catch an idea that has not taken shape

First give materials and thoughts a place, and keep room to understand them and sort them further.

Execute: separate preparing from doing

Separate to-execute from in progress, so what you are preparing to do and what you are doing are clearer.

Settle: confirm after it is done

Use to-confirm and confirmed to receive the result, and leave a way in for review and for looking back later.

Scope shown: an interface sketch, a screenshot of the current interface, and the comparison interaction. The case focuses on how information is organized and on visual iteration. Sample counts in the screenshots do not represent actual use.

04 / A LITTLE CONTINUITY

Starity

With Xiaoji, leave the everyday as a little glow.

Let what was done together be picked up again.

Starity grew out of my everyday collaboration with Xiaoji. Sometimes I want to note a bit of inspiration, sometimes to see how far a project has gone, and sometimes to find a conversation again. It gathers these needs into three entries — timeline, tasks, and conversations — and keeps a personal feel with cat stickers and a background that can be customized.

Format · Personal companion board / mobile web and PWA

My role · The need and the experience, the aesthetic direction, and building it together with Xiaoji

Scope shown: five phone photos from Alin, plus a separate check of keyword search on this device and of expanding the full text. Sync badges, record counts, and task states belong to the picture. They are not used here to infer that sync across devices, or results of use, have already been verified.

STARITY / ACTION AND PERSONAL SPACE

From looking back at the day, to acting, and to finding it again.

01

Leave the next step

Tasks are grouped as under construction, to polish, and cruising. The place can be chosen when adding one, so there is less of the back-and-forth of writing it down and sorting it later.

02

Change it to your own mood

From the merch frame, enter hand drawings, album stickers, and custom sets, and match the background together with the cat.

Make dress-up part of the everyday experience

I proposed letting the Starity background echo and match the merch frame, and letting an outfit be changed at any time. The dress-up workshop organizes hand drawings, album stickers, and managing sets into choices that are easy to understand.

Trade-off / Background and texture can be rich. Text and controls still need to be clear enough. Decoration cannot get in the way of looking back or of entering something.

Phone photo 02 / task list: the add panel and the groups are visible at the same time, so a task's state can be chosen while entering it.

STARITY / FIND THE THREAD AGAIN

Let the collaboration leave a continuous thread, and leave a taste of your own.

Keep the source of the collaboration in real conversations

Conversation search offers a keyword, filtering by role, and expanding the full text. In a long collaboration, picking an idea back up requires being able to find how it was said before.

Trade-off / There is a lot of history. Summaries and filters should help narrow the range. The number of records on the screen only says how much content was there at the time. It is not the same as the quality of the search.

Split looking back, action, and source into three entries

The timeline tells what happened. Tasks hold what to do. Conversation search answers how it was talked about then. The same visual language keeps a switch of content familiar.

Trade-off / You have to switch between entries, so each page needs to say clearly what it currently holds, and to keep the navigation light.

What exists now

- Formed entries for the timeline, tasks, conversation search, and dress-up, and showed them in five phone photos.
- Search on this device has been checked: keyword search and expanding the full text of a record can find a real past conversation.
- Kept the collaboration from a personal need and a visual idea through to building it together with Xiaoji.

What I want to test next

- In real use on a phone, keep adjusting type size, spacing, and background contrast, so looking back for a long time is more comfortable.
- See whether the timeline, tasks, and past conversations need a more direct way to connect to each other.
- Keep checking how state connects, and how records are managed, when it is used across devices.

Scoped to what is visible: the timeline, tasks, conversation search, and dress-up. Conversation search covers keyword search on this device and of expanding the full text. Sync badges, record counts, and task states belong to the picture. They are not used here to infer that sync across devices, or results of use, have already been verified.

A LITTLE WORLD, SHARED

A little house, *many have visited.*

Naituan's Little House · 奶团小屋

With a white red panda, arrange the house and play a few small games.
No tutorial, and no urging — just to be gently caught when you come back.

THE ONGOING EXPLORATIONS

Curiosity, *still going.*

A few AI and tool experiments that grew from close by.

01 / AN AI WITH CONTINUITY

Stone

Each time you start again, you can still catch your earlier self.

Still exploring conversation digest, memory recall, and how context is organized. Customized from open-source projects, from Reasonix to DSH, looking for an implementation closer to a personal need.

Conversation digest · Memory recall · Open-source custom

Personal system · still iterating; some plugins are still being checked

02 / A COMPANION WITH CONNECTIONS

Xiaopi

From one sentence on the phone, connect the tools at hand.

A mobile chat connects to a local assistant, and gradually brings the timeline, agreements, and tool abilities into the day. Directions such as games and sensing the device are still being explored.

Mobile entry · Local gateway · MCP tools

Personal project · mobile interface and a local bridge
